

THE CALAIR SKYFOX – ORIGIN, DERIVATIVES & PRODUCTION LISTS

by

D. G. CAMERON

When Dan Denney first flew his prototype Kitfox on 7th May 1984 in Idaho, USA little did he realize how popular the basic design would become as both a home built, kit aircraft and as a fully factory built product. Before long licence built versions with more or less local modification were being produced in the Philippines, Portugal, South Africa, Germany and Australia.

DENNEY KITFOX

The Kitfox is a side-by-side, two-seat, high wing monoplane aimed at the gap between the traditional light recreational and training aircraft and the ultra/microlight types often selected by the home builder. It and its derivatives have filled this gap very well. It was eventually developed into a range of models initially capable of taking either of several Rotax or a KFM engines ranging from 38.8kW (52hp) to 48.5kW (65hp). All early Kitfoxes came with a pseudo radial engine cowling.

With time the engine range was expanded even further, especially after the Kitfox program was taken over by SkyStar Aircraft in 1993. By 2000 the Series 6 was being offered with five engine options from the 59.7kW (80hp) Rotax 912 to 93kW (125hp) Continental IOP-204B. By that stage there was also a single seat Kitfox Lite with a 26.1kW (35hp) engine. The standard model by 2000 was the Kitfox Classic IV with the Rotax 912 engine.

Initially a tailwheel aircraft the 2000 Series 6 convertible could be changed between tailwheel and tricycle undercarriages after construction, while float and ski versions of the Denney Kitfox had been available quite early, certainly by 1987.

It was estimated that a kit builder with average experience could construct the early Denney versions in between 500 and 600hrs. This was made possible because the kit was delivered in one large box with all the welding of the steel tube fuselage and many of the subsystems factory-completed. The claim was that the kit was sold complete with everything but the fuel. They also came with a rapid (2min) wing-folding system that allowed towing the aircraft to the home garage.

OVERSEAS PRODUCTION

By 1988 licence production, as the Skyfox, had commenced in Manila by Philippine Aircraft Company Incorporated but their efforts were far from successful and it would appear only a handful of aircraft were completed there over quite an extended period. References have also been sighted to production in Portugal, apparently by Hedaro, and South Africa, however the author has not been able to locate any indications of success or otherwise of these two ventures, except that they were linked in one case to that in the Philippines. The same reference also indicates more success was being achieved in Germany by Ikarusflug and in Australia by Calair/Skyfox. Nothing further is known of the German product. The Australian effort is covered in detail below.

CALAIR CORPORATION & THE CA21 SERIES

Australian production as the Skyfox, was initiated at Caloundra, Qld by a newly formed company, Calair Corporation. Calair was first listed on the second board of the Brisbane Stock Exchange on 12th October 1989 with Managing Director Stuart Pryor and John Griffiths of Southern Cross Corp., Toowoomba, as the major shareholders. However, its prototype CA21 aircraft, VH-CAL, had flown, at Caloundra on the 15th September that year. VH-CAL, incidentally, was still flying, as 55-4140, as late as May 2009 having served as the Skyfox Research and Development Aircraft at least until May 1998. In this guise it would have served as the prototype for the succeeding CA22 and CA25 & 25N models.

The CA21 was a fairly simple adaptation of the Kitfox with only 38 modifications required by the time it was certified. In appearance the major change was to discard the dummy radial engine cowling of the Kitfox for a flatter and more streamlined shape, which slightly increased airspeed, although a first flight photograph of VH-CAL shows that it initially had the radial cowling. As well, the V wing bracing struts were attached 40cm further along the wings, wing dihedral was slightly increased and the fuselage frame steel tubing was of a larger size allowing an increase in loaded weight. This was from 420kg at 4g for the Kitfox up to 463kg (1 020lb) at 6.6g. A taller, by 50mm, fin and rudder were fitted, both of equal height and the rudder and elevator chord was increased by 25mm. The Kitfox wing folding ability was retained. These changes brought it up to Australian CAO 101-55 standards. These standards are for commercially built ultralight aircraft under 450kg empty weight, with two seats, which can be used for general aviation pilot training purposes. It was designed to carry two 90kg passengers. Certification to this standard was achieved in mid 1990 and it was the first aircraft in Australia to be so certified, the process taking nine months to achieve.

It was a STOL, two seat, braced high wing, cabin monoplane developed for pleasure, training and surveillance with completed aircraft sold direct to users. These, initially at least, were delivered to the purchaser by air. The fuselage, landing gear and tail structure were all of welded steel tube and the wing had two aluminium tube spars with ply ribs and drooped fibreglass tips akin to those on later Cessnas. The airframe in general was fabric covered but a fibreglass cowling covered the engine. The Perspex windscreen extended over the top of the cabin to improve the field of vision. As well, Perspex doors were provided and these were hinged at the top. This enabled them to be opened upwards and clipped up parallel with the wings in flight. Conventional three axis controls were provided with full span ailerons. The rudder controls were cable operated but steel rods operated the elevators and ailerons. The engine in the CA21 was a 2.1lt, 58.2kW (78hp) Aeropower built in Perth, WA. The Aeropower unit was essentially an Australian built Volkswagen adaptation.

After the prototype CA21001 (VH-CAL) Calair built two airframes CA21002 & 3 which were severely stress tested as part of the Australian certification process. These three airframes, plus other miscellaneous remnants, provided the basic material from which an aircraft, now in possession of Queensland Air Museum, will eventually be restored to display standards. The wings are those originally tested on VH-CAL to a speed in excess of the design maximum as part of the certification process. This airframe has been donated by Skyfox Flying School, after it had served as an advertising symbol for the School, on a pole beside the Bruce Highway at Glenview, near Caloundra.

TABLE 1

Constructor's number, civil registration (initial and subsequent), date of completion or initial sale and name & location of the initial purchaser of the CA21 Skyfox aircraft built by Calair and Skyfox Aviation, July 1990 to August 1991.

Sold in July 1990 the first production aircraft, CA21004, was followed by 25 more (013 not used) up to CA21030 of March 1991, before Calair was reorganised and became Skyfox Aviation who produced and sold a further seven between May and August 1991 and rebuilt 012 as 037. Of these 33, five from Calair and one from Skyfox production, were registered in the general aviation (VH) category. All the rest were registered in the ultralight (55) class. (Table 1). Most of the surviving CA21s were eventually changed to 55- series registrations. The last Calair aircraft (CA21030) went the other way becoming VH-LRD in 1991.

SKYFOX AVIATION & THE CA22 SERIES

In early 1991 Calair was purchased by Graham Day, a former Boeing 737 pilot, and reorganised as Skyfox Aviation Ltd with himself as Managing Director and David Anning as General Manager. Despite an optimistic announcement in April 1992 of “*a contract to annually supply 120 examples of its Skyfox two seat ultralight to customers in Europe, Japan, the UK, PNG, Borneo, Hong Kong and other countries. Worth about \$60m and expected to extend over 11 years*” difficulties in raising adequate finances to meet these commitments were apparently experienced. It was converted into a public company in 1996 but ceased production in May 1998. Having been unable to obtain sufficient funds to meet its ongoing commitments, it was placed under voluntary administration.

In conjunction with the production side of their business Calair and later Skyfox had run a flying school but, with the creation of the public company in 1996, the Skyfox Flying School was set up as a separate private company. It is still operating at the time of writing (May 2009).

By the second and main early production model, the CA22, there had been some 180 component changes. With the CA22, which first flew in January 1992, a change was made to the Bombardier Rotax 912 engine of similar power to the Aeropower of the CA21. By June 1992 the vertical tail surfaces had been further adjusted with the fin height and aspect ratio increased. The rudder size was not altered but it was inset into the taller more slender fin which now swept back over the top of the rudder. From December 1992 the previously round tubular metal wing struts were replaced by aerodynamically shaped aluminium struts.

The CA22 was also eventually stressed and tested for registration for European Joint Airworthiness Requirements for Very Light Aircraft (JAR/VLA) criteria. This required a full retesting and recertification of the whole aircraft. It was the first Australian aircraft certified in this category when it passed in June 1993, and was possibly a world first. These aircraft became the CA22A and in the aviation press, but apparently not officially by Skyfox, they were known as the Elan. From September 1993 later versions, the CA25, named Impala by the press, and CA25N Gazelle, the later an official Skyfox name, were the main JAR/VLA registered models.

Of the 61 aircraft listed in Table 2, seven were initially registered in the general aviation VH series, although a number were later changed to the 55- series. A number, mostly the VH series registrations, were upgraded to JAR/VLA standards, either at the initial sale stage or at a later date. As mentioned earlier, these 12/13 aircraft were apparently at times referred to as CA22A Elan. A further seven were exported to the Heritage Flying Co., Bangkok, Thailand. The remainder were all registered in the ultralight 55 category. Two late production CA22s went to Malaysia.

TABLE 2

Constructor's number, civil registration (initial and subsequent), date of completion or initial sale and name & location of the initial purchaser of the CA22/CA22A Skyfox aircraft built by Skyfox Aviation, late 1991 to mid 1995.

Looking at the purchasers' localities (Tables 1 & 2), it is noticeable that, after Skyfox Aviation came into being, there was a much higher proportion of sales within Queensland. Queensland based sales for the CA21 were four out of the ten produced by Skyfox but only two of the 26 Calair machines were initially sold in Queensland. Twenty seven of the 61 CA22s were initially sold in Queensland, 16 of these were in the last 32 of the group shown in Table 2.

THE CA25 & CA25N GAZELLE SERIES

Once the JAR/VLA certification had been completed (June 1993) the series number was changed to CA25 and these were initially only registered in the general aviation (VH or equivalent) series. Construction number CA25001 does not appear in Table 3 and was probably VH-CAL, the general development aircraft or a special airframe tested to beyond the designed stress levels and discarded. The first production aircraft, again fitting the Rotax 912 engine, was registered HB-SCE to the Swiss distributor and taken on a sales tour of Europe. By September 1993 Skyfox were offering customers two models, the CA22 for \$49 000 in the 450kg, 101:55 ultralight category and the CA25 for \$55 000 with a basic VFR package or \$60 000 with gyros/instruments for use by flying schools. At that stage they were producing one aircraft every 10 days and aviation journalist Brian Creer had joined the company as its Marketing Manager.

The next stage in the development of the Skyfox was the production of a model with tricycle landing gear. This was precipitated by requests from both flying schools and their students for this type of training aircraft and by suggestions from the company's Swiss agent that such an aircraft would sell well in Europe. The Swiss supported their view with funds towards the tricycle development. As a result the name Gazelle was formally chosen by the company as a play on the Swiss Principal's name, "Gisela". The N in the model designation, CA25N, refers to the nosewheel. The prototype flew early in 1995 and was soon followed by production specimens.

NB:- This listing is incomplete, especially for the CA25/25N models, as production continued for at least another 18 months after this compilation ends.

By the end of 1996 ten CA25s had been produced and 66 CA25Ns. Of these 76, one N soon received British registration (G-IDAY), three, two CA25s and one CA25N, including the first production CA25, Swiss codes (HB-SCE, HB-SCF & HB-SCG), one CA25 went to Thailand

and one N eventually went to the USA. One 1994 produced aircraft was also sold in 2001 to New Zealand (VH-PNB became ZK-PNB) and CA25N024 went to Korea in 2002.

In summary, 17 Skyfox of all types are known to have been exported , eight to Thailand, three to Switzerland, two to Malaysia and one each to the UK, USA, New Zealand and Korea.

It is also noticeable (Table 3) that locations of more and more purchasers moved even closer to Caloundra as the reputation of the aircraft grew. As well, as familiarity with the design grew, more repeat and multiple purchases began to appear in the lists. This suggests that the product was being well received.

Certification of the Gazelle was more protracted than first envisaged. Initial expectation was that it would only require a supplementary type approval but, because of the extensive rework of the fuselage needed to support the strong nose leg and revised main wheels, a completely new type certificate was required. The end result was a highly successful aircraft substantially out-selling the tail wheel CA22 and CA25 which were still being produced as required. Only the financial problems of the company precluded its long term success.

Production ceased, initially only temporarily, in May 1998 but it was never restarted.

Later Gazelles were registered under a new Recreational Aircraft 24- prefix and the majority of the others were eventually transferred to this category. At the time of writing, there are 15 Skyfox types on the VH- register, 70 on the 55- register, 65 on the 24- register and 1 on the New Zealand (ZK-) register.

TABLE 4

Constructor's number, initial and eventual civil registrations of Skyfox CA22 & CA25N Gazelle aircraft built after separation of the production and flying school arms of Skyfox Aviation in late 1996 until May 1998.

CA25N094	24-4022	(Incomplete at demise of Skyfox Aviation. Completed by Flying School personnel).

SOURCES & ACKNOWLEDGEMENTS

Particular thanks are due to John McBryde of Skyfox Flying School, Caloundra, for his considerable assistance in the preparation of this paper. This has involved the provision of the production lists used initially to compile Tables 1 to 3. This list was complete up to the time the Flying School separated from the production company. The list is labelled "Updated 8 May 1997" but only covers those aircraft completed up to late 1996. John also read and commented on the manuscript for its accuracy of interpretation of the minimum literature available to me.

Thanks are also due to Tony Arbon of AustAirData for the provision of his complete list of Skyfox aircraft and their registration histories. Table 4 is entirely from Tony's list which was also used to expand Tables 1-3. Tony also provided the current (May 2009) VH, 55, and 24 register numbers.

NOTES

1	<p>ex Nilsson, Carl (April 2010) :- Pers Com.</p> <p>CA22027 (55-0688) shown as “crashed 6km E. Romsey 1999” was repaired and is still flying in Tasmania. Following a recent accident the wings have been respared. The early CA22 models had 0.5in (12.7mm) diameter moly steel longerons but by CA22027 0.625in (15.88mm) tube was being used.. Skyfox also used a custom made A1 6061 spar with an internal web that was considerably stronger than that on the Kitfox.</p> <p>“In fact, then owned by Aussieflying P/L (my company) and operated by Ultralight Flying Machines at Penfield it was force landed near Romsey in 1999 due to engine failure. The undercarriage, right wing tip and aileron were damaged in the landing. However, it was repaired by the late Mike Valentine and another Rotax 80 hp installed by Greg Jack. I flew it to Hobart in 2002 where I have operated it since with the Aero Club of Southern Tasmania at Cambridge, Tas. It retains reg. 55-0688. I have flown it back and forth to the mainland several times. It is still registered with RA-Aus and, while it has been out of action for twelve months for another reason, it will be flying again shortly.”</p>
